# Alzheimer's disease drug trials:

1998

2019

A microscopic image showing several neurons with dark, triangular cell bodies and a dense network of branching processes. Several dark, oval-shaped plaques, identified as amyloid beta, are visible, some attached to the neurons and others floating in the surrounding space. The background is a light, textured beige.

n=4 per group

- Libraries prepared with whole-brains
- polyA-enriched
- single-end 75bp reads, Illumina NextSeq
- Quality trimmed
- Aligned to GRCz11 with STAR
- FeatureCounts

# Summary

- RNA-seq analysis in a zebrafish model of familial Alzheimer's disease has given us insight into potential early disease-causing changes in the brain.
- Genes with Iron Responsive Elements can give us more information about iron homeostasis than existing gene sets.
  - Revealing possibly shared mechanisms in familial Alzheimer's disease and hypoxia
